

We commit ourselves to reducing our energy consumption and CO₂ emissions through the espousal of energy principles continuously and sustainably while complying with relevant legal requirements. This is controlled through the setting of our energy targets, which are defined by the management annually. Our foundation is established based on our knowledge of our consumption and production history as well as the economic efficiency measures.

This is implemented with the inclusion of an energy management system within our existing IMS system in which:

- Energy consumption is continuously measured and monitored.
- Ensure the availability of information and necessary resources to achieve objectives and energy targets
- Satisfy applicable legal requirements and other requirements related to energy efficiency, energy use, and energy consumption;
- Continual improvement of energy performance and the EnMS;
- Support the procurement of energy-efficient products and services that impact energy performance;
- Support design activities that consider energy performance improvement;
- Ensure this policy is communicated at all levels within the organization and available to interested parties as appropriate
- Relevant energy aspects are regularly recorded, reviewed, and communicated.
- Energy flows are recorded and kept up to date.
- Processes and activities are regularly evaluated towards their energy efficiency and continuously improved.
- Energy-saving measures are planned and implemented.
- The results of energy-saving measures are recorded, analyzed, and evaluated at regular intervals.
- Necessary resources and information are provided by the management to achieve the energy targets.

The successful implementation of these principles requires the participation of the top management, all employees, and service providers. Our employees are fully informed about and involved in our energy management program. The energy principles of the company apply equally to all departments, activities, and procedures to ensure the continuous improvement of our energy performance.
